

There is a compelling need for skill sharing - reaching and practicing across the professional clinical domains of others. Patients benefit from, and have a right to, more connected care, practitioner motivation and retention improves, and employers gain from health services and systems that are more agile and responsive. Trouble is, despite a plethora of pilots and plentiful commentary over the last forty years, we're still battling turf tension, conventionally held beliefs about practice, and silos. This presentation will show how an "authorizing mechanism" is the key to unblocking the log-jams, building the bridges, and generating the momentum that is needed - for better patient outcomes - now!
